}

```

We need to group by subject, wave, and trial, select just the FailedStop trials, and just the high trial numbers, then get the min and max accumbens activity. We could even do a long transform across the ROIs, then also group by ROI and get the min and max for ROIs

So let's first long transform the ROIs

Then do the grouping and summarizing.

We define a peak period and trough period based on the previously observed shape of the accumbens response in the FS trial. This will put a peak around 2-6 seconds and a trough around 7-10 seconds. These values were chosen subjectively to try to encompass the peak and trough allowing for as much variability as possible without grabbing unrelated data from other time points. With a TR of 2.0 we should always have one or two images to grab from within these ranges, too.

```

Basic Striatal cluster mixed effects models

All trial types, with P_Stop

I think if you're going to do P_stop

- P_stop_trial seems mostly irrelevant and P_stop_trial_post is a more relevant measure; P_stop_trial_change is more relevant still.
- measuring P_stop_trial rather than P_stop_trial_change doesn't make much sense, but
- If you're only measuring FS, neither P_stop_trial_post nor P_stop_trial_change are necessarily going to measure what you think because the data is censored to just FS trials, which are *always* going to move in a particular direction
- so while measuring P_stop_trial, it's best to do a model with all kinds of trials

Table 1: stop conditions, with condition

## 1164      0.001772989      19.0   FailedGo
```

```
plot_final<-ggplot(df_offset,
  aes(x=offset_start, y=CueFollowing.CS.FS.striatal_cluster_combined,color=condition))+
  geom_line()+
  #facet_wrap(~ROI,ncol = 2)+
  ggplot_time_points_extras

  #geom_point()+
  #geom_smooth(method="loess",span=2,na.rm=TRUE) + #https://ggplot2.tidyverse.org/reference/geom_smooth
  #scale_y_continuous(limits=c(-2.5,2.5))
```

CS-FS

Let's now try to contrast these time series to see what the CS-FS looks like. This will be interesting because it's similar to the simple GLM result I got earlier that set me down the path of trying to analyze this.

```
trial_tps_compare_conditions<-df_offset %>% pivot_wider(id_cols=c(offset_start),names_from = "condition")
trial_tps_compare_conditions$CS_minus_FS<-trial_tps_compare_conditions$CorrectStop-trial_tps_compare_conditions$IncorrectStop
```

Figure 2:

```
ggplot(trial_tps_compare_conditions,
  aes(x=offset_start, y=CS_minus_FS))+
```

```
#geom_tile(data = next_trial_gradient, aes(x=tp,alpha=pct_in_range,y=0),fill="#000000",color="transparent")
geom_tile(data = next_trial_gradient, aes(x=hrf_tp,alpha=pct_in_range,y=0),fill="#77ff77",color="transparent")
#annotate("text",x=4,y=0.25,label="Subsequent Go Trial\nTime Range",size=2)+
annotate("text",x=10,y=0.22,label="Subsequent Go Trial\nExpected HRF",size=2)+
scale_alpha_continuous(name="Subsequent go trial range", range=c(0,0.7),labels=scales::percent_format(1))+
geom_line(size=1,alpha=0.5)+
scale_color_viridis_d(option = "C")+
ggplot_time_points_extras+
coord_cartesian(ylim=c(-0.15,0.25))+
labs(y="CS-FS BOLD activity difference")
```

OK, so from this graph it is very clear why, during the subsequent trial, we're seeing positive striatum activity, and it is also clear there is a large dip in the same area right after the tone.

Figure 3:

```
count_subjs <- function(df){length(unique(df$subj))}
subj_count <- length(unique(time_points_c$subj))
ggplot(df_offset,
  aes(x=offset_start, y=CueFollowing.CS.FS.striatal_cluster_combined,color=condition))+
  geom_line()+
  #facet_wrap(~ROI,ncol = 2)+
  ggplot_time_points_extras
```
